                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a target antigenic peptide derived from the CDR2-like domain of the human CD4 protein. The peptide is cyclised by the CDR2-like domain of cysteine residues at either end. The specification describes antigenic peptides derived from the CDR2-like domain of CD4 (amino acids 27-66 of AAY54500). These antigenic peptides present contralising receptor/co-receptor effector sites of the CDR2-like domain. The peptides evoke effective antibodies block human immune deficiency virus specificity. The induced antibodies block human immune deficiency virus specificity. The induced antibodies block human immune deficiency virus interactions with other cells, deliver signals to T cells (inhibiting normal CD4+-mediated immunoregulatory functions) or induce apoptosis of normal CD4+-mediated immunoregulatory functions) or induce apoptosis of CD4 cells by simultaneous engagement of T cell receptors. Conjugates and peptides containing the antigenic peptides are used for active immunisation to generate antibodies against CD4 surface complexes, especially to prevent binding of HIV to CD4 and thus HIV infection, but also to treat undesirable immune responses such as transplant rejection, or autoimmune diseases (frheumatoid architist, systemic lupus erythematosus or psoriasis). These conjugates produce high-titre antibodies which are broadly neutralising against primary isolates from all classes of HIV-1 and of HIV-2. The peptides may include a promiscuous Thelper epitope that is active in genetically diverse subjects
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The present invention relates to polypeptides that bind cellular receptors for vascular endothelial growth factors (VEGFs), the polymuleotides encoding them, and their use for identifying agents that modulate interactions between VEGFs and their receptors. VEGFs and their receptors play an important role in vasculogenesis, the development of the embryonic vasculature from early differentiating endothelial cells and angiogenesis, the process of forming new blood vessels from precentsting ones. Modulators of interactions between VEGF and its receptors existing ones. Modulators of interactions between VEGF and its receptors may be used to treat dysfunction of the endothelial cell regulatory system. Such disorders include cancers, abnormal angiogenesis, renumatoid proliferative retinopathies, age-related macular degeneration, rheumatoid receptor binding profiles compared to known naturally occurring VEGFs.

ANUOR446-AAUOR454 represent the peptides Al-A9 which are encoded by human VEGFA forward primers used in the methods of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polypeptides that bind cellular receptors for vascular endothelial growth factors, polynucleotides encoding them.

                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence is an immunogenic fragment of feline immunodeficiency virus (FIV) glycoprotein 130. Peptides AAY57018-Y57019 (also fragments of gpl30) are used in the invention sa capture polypeptides when diagnosing FIV infection. The invention relates to an antibody binding composition which consists of an enhanced capture polypeptide, which contains an immunogenic fragment of FIV gag precursor p55, and a second fragment which is part of the env precursor gpl30, and an antibody-binding detection composition. The invention also includes a device for performing an assay which determines whether a feline is infected with Immunodeficiency Virus infection

This is an example of a glutamine donor peptide that can be utilised in novel recombinant protein polymers of the invention. Such polymers (see AAM49710-28) typically comprise a repetitive amino acid backbone of repetitive units having a collagen, fibroin, elastin or keratin motif and at least 2 enzyme recognition sequences comprising a glutamine and/or lysine capable of enzyme catalysed isopeptide formation. The polymers are capable of covalent crosslinking by enzymatic reaction to form products which set quickly and have good adhesive properties and high strength. They can be used as medical adhesives and sealants, in the closure of wunds and repair of damaged tissues, prosthesis coatings, drug depots, and matrices for the transplantation of cells. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                               New recombinant protein polymers - containing naturally occurring repetitive units for crosslinking by enzymes, useful as medical adhesives and sealants, depots and matrices.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New peptides which selectively home to organs or tissues, used for, e.g. identifying target ligands and for therapy of pathological conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Homing peptide; organ; tissue; lung; pancreas; skin; retina; MDP; prostate; ovary; lymph node; adrenal gland; liver; gut; tumour; membrane dipeptidase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The peptides AAR80351-70 are examples of glutamine donor peptides which can be used to generate protein polymeric adhesion substrate (PPAS) contg. repeats of non-fibrin cross-linking donor peptide sequences (see AAR80345-50 for examples of PPAS proteins). The PPAS proteins can be used as substrates in enzymatic cross-linking reactions catalysed by a transglutaminase enzyme e.g. Factor VIII or XIII. The polymers can be used in biological systems where in situ formation of a biocompatible material with structural integrity is required e.g. as medical adhesives and sealants or for wound closure or tissue repair
                 Pendent group; repeating unit; enzyme recognition site; sealant; fibrin; enzymatic cross-linking; blocompatible material; structural integrity; medical adhesive; wound closure; tissue repair; transglutaminase; protein polymer adhesive substrate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                               Protein polymers comprising repeating units and sequences - capable enzyme-catalysed covalent bond formation useful as a biocompatible material for wound closure and tissue repair.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Protein polymer; adhesive sealant; wound healing; cross-linking.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The present invention describes peptides that selectively home to a tissue or organ. The peptides can be used for identifying an organ or tissue, for identifying a target molecule expressed by an organ or tissue or for treating an organ or tissue pathology, where the organ or tissue is selected from prostate, lung, skin, retina, pancreas, gut, ovary, adrenal gland, liver, and lymph node. The peptide bind to the membrane dipeptidase (MDP). AAV48618 to AAV49066 represent sequences which are used in the exemplification of the present invention. (Updated on 20-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to a novel method for identifying disease targeting peptides. The method comprises exposing a sample from an organ, rissue or cell type of interest, to a phage display library and recovering phage bound to the sample (the phage expresses targeting peptides). The peptides identified by the method of the invention may have cytostatic, immunosuppressive, anti-inflammatory, antiarthritic, antiatherosclerotic, antidiabetic, antibacterial and antiviral activities. The methods and composition are useful for identifying targeting peptides and one or more receptors for a targeting peptide. The targeting peptides are used for selective delivery of therapeutic agents, including gene therapy vectors and fusion proteins, to specific organs, tissues, or cell types in subject. The targeting peptide may also be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Identifying targeting peptides useful for treating e.g. diabetes mellitus, inflammatory diseases, cancer, or autoimmune diseases, comprises exposing a sample to a phage display library and recovering phage bound to the sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Targeting peptide; cancer; Hodgkin's disease; cytostatic; immunosuppressive; anti-inflammatory; antiarthritic; antiviral; antiatherosclerotic; antidiabetic; antibacterial; diabetes mellitus; inflammatory disease; arthritis; atherosclerosis; cancer; autoimmune disease; bacterial infection; viral infection.

Sequence 21, Application US/09761636A

Patent No. US20020065218A1

GENERAL INFORMATION:

APPLICANT: ACTEN, Marc

APPLICANT: STACKER, Steven

APPLICANT: CENDROW, Angle

TITLE OF INVENTION: VEGF-D/VEGF-C/VEGF PEPTIDOMIMETIC INHIBITOR

FILE REFREENCE: 1064/48505 Achen et al

CURRENT APPLICATION NUMBER: US/09/761,636A

CURRENT PILING DATE: 2001-01-18

PRIOR APPLICATION NUMBER: US 60/176,293

PRIOR PILING DATE: 2000-01-18

PRIOR FILING DATE: 2000-05-16

NUMBER OF SEQ ID NOS: 34

SEQ ID NOS: 34

SEQ ID NO 2

US-09-258-754-49
is Sequence 49, Application US/09258754
; Patent No. 6174687
; GENERAL INFORMATION:
; APPLICANT: Radelini, Erkki
; APPLICANT: Rajotte, Daniel
; APPLICANT: Rajotte, Daniel
; TITLE OF INVENTION: Methods of Identifying Lung Homing Molecules Using
; TITLE OF INVENTION: Membrane Dipeptidase
; TITLE OF INVENTION NUMBER: US/09/258,754
; CURRENT FILING DATE: 1999-02-26
; EARLIER FILING DATE: 1998-03-13
; NUMBER OF SEQ ID NOS: 452
; SOFTWARE: PatentIn Ver. 2.0
; SEQ ID NO 49
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 49.

Sequence 49.

Sequence 49.

Batent No. 623287.

GENERAL INFORMATION:

APPLICANT: Rouslahri, Erkki

APPLICANT: Pasqualini, Renata

TITLE OF INVENTION: Molecules that Home to Various Selected Organs or

TITLE OF INVENTION: Tissues

TITLE OF INVENTION: Tissues

TITLE REFERENCE: P.LJ 2892.

CURRENT APPLICATION NUMBER: US/09/042,107

CURRENT FILING DATE: 1998-03-13

NUMBER OF SEQ ID NOS: 436

SOFTWARE: PatentIn Ver. 2.0

i Sequence 100, Application US/08397633A

i Patent No. '5773577

GENERAL INFORMATION:

APPLICANT: Cappello, Joseph

ITLE OF INVENTION: PRODUCTS COMPRISING SUBSTRATESCAPABLE

TITLE OF INVENTION: OF BNZYMATIC CROSS-LINKING

CORRESPONDENCES: 105

CORRESPONDENCE ADDRESS:

ADDRESSEE: FLEHK, HOHBACH, TEST, ALBRITTON & HERBERT

STREET: 4 Embarcadero Center, Suite 3400

CITY: San Francisco

STATE: California

Sequence 33, Application US/09258754

Fatent No. 6174687

GENERAL INFORMATION:

APPLICANT: Rajote, Daniel

TITLE OF INVENTION: Methods of Identifying Lung Homing Molecules Using

TITLE OF INVENTION: Membrane Dipeptidase

FILE REFERENCE: P-LJ 344

CURRENT FILING DATE: 1999-02-26

EARLIER APPLICATION NUMBER: 09/042,107

EARLIER FILING DATE: 1999-03-13

NUMBER OF SEQ ID NOS: 452

SOFTWARE: PatentIn Ver. 2.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      APPLICANT: Ruoslahti, Erkki

Vicelogenin, 190k chain - gypsy moth (fragment)
N;Contains: vitellin
C;Species: Vitellin
C;Species: Unymantria dispar (gypsy moth)
C;Date: 21-Uni-1995 #sequence_revision 28-Uni-1995 #text_change 15-Oct-1999
C;Accession: A61622
R;Hiremath, S.; Eshita, S.
Insect Biochem: Mol. Biol. 22, 605-611, 1992
A;Title: Purification and characterization of vitellogenin from the gypsy moth, Lymants A;Reference number: A61622
A;Reference number: A61622
A;Accession: A61622
A;Accession: Dreliminary
A;Accession: Dreliminary
A;Resendente: protein
A;Residues: 1-10 <HIR>
C;Keywords: egg yolk; hemolymph

Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine

Cendron A;

Stacker S,

WPI; 2001-442248/47.

Achen MG,

(LUDW-) LUDWIG INST CANCER RES. Hughes RA, The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabeta carbon separation distances on opposite antiparallel strands of a

residues.

```
peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides) and a cyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis, covariation or lymphanglogenesis in a mammal with a condition characterised by angiogenesis, neovascularisation or lymphanglogenesis. The condition is diabetic retinopathy, psoriasis, arthropathy, cerebrovascular accident, post-angioplasty restenosis, head, heat or crowary cerebrovascular accident, post-angioplasty restenosis, head, heat or trauma, substance-induced neovascularisation of the liver, excessive trauma, substance-induced neovascularisation of the liver, excessive trauma, substance-induced neovascularisation of the liver, excessive trauma, peptides are also used to modulate vascular permeability accumulation. The peptides are also used to modulate vascular permeability accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to induced by VEGF, VEGF-C or D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and

                                                                                             whose 3-dimensional structure is modelled on the expose loop of human VEGFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabeta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptides worldsing the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis, necessarion or lymphangiogenesis in a mammal with a condition
                                                                                                                                                                                                                                                                                                   characterised by anglogenesis, neovascularisation or lymphangiogenesis. The condition is diabetic retinopathy, psoriasis, arthropathy, hemangioma, vascularised malignant or benign tumour, post-recovery cerebrovascular accident, post-angloplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive hormone-related anglogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver
                                                                                                                                                                                                                                                                                                                                                                                                                                           infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF. VEGF-C or -D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and
                                                                            The sequence represents a monomeric monocyclic peptide of the invention,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human CC whose 3-dimensional structure is modelled on the expose loop of human cCC whose 1-dimensional structure is modelled on the expose loop of human cCC weight (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta-ccc peptide. The peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis,

CC peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis,

CC peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis,

CC condition is diabetic retinopathy, psoriasis, arthropathy,

CC characterised by angiogenesis, neovascularisation or lymphangiogenesis.

CC characterised by angiogenesis, neovascularisation or lymphangiogenesis.

CC characterised by angiogenesis, neovascularisation of the liver, excessive cerebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF, VEGF-C or D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, expecially release to the correction of the peptides are used to intended to correction of the correction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                          Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

whose 3-dimensional structure is modelled on the expose loop of human VECFD (vascular endothelial growth factor). The invention relates to a method of producing a monometric monocyclic peptide by a measuring betace the carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclisting the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis, concevation are used to interfere with angiogenesis, concevery condition is diabetic retinopathy, psoriasis, arthropathy. The condition is diabetic retinopathy, psoriasis, nead, heat or cold trauma, substance-induced neovascularisation of the liver, excessive cordinal angiogenic dysfunction, diabetees induced neovascular certenosis, head, heat or crauma, substance-induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability corbination in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic corbinateion in peripheral limbs or in lungs, peritoneal cavity, pleura, are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and dispersional archivity induced by VEGF, or brain and and continued archivity induced by VEGF, or brain and and continued archivity induced by VEGF, or brain and and continued archivity induced by VEGF, or brain and and continued archivity induced by VEGF, or brain and and continued archivity induced by VEGF, or brain and and continued archivity induced by VEGF, or brain and and a continued archivity induced by VEGF, or brain and a continued archivity induced by VEGF, or brain and a continued archivity and and a continued archivity and a continued archivity and a cont
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        sequence represents a monomeric monocyclic peptide of the invention,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                       AAU04532;
  The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGPO (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta carbon separation distances on opposite antiparallel strands of a cyclising the peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide with at least one amino acid deleted nanocyclic peptides, dimeric bicyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis.

The condition of lymphangiogenesis in a mammal with a condition characterised by angiogenesis, neovascularisation or lymphangiogenesis.

The condition is diabetic retinopathy, psoriasing authropathy, chemangioma, vascularised malignant or benign tumour, post-recovery cerebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive creamed angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VBGF. VEGF-C or -D and are also used in combination with an anti-inflammatory agent, to treat chronic inflammation, especially rheumatoid arthritis, psoriasis and
diabetes induced neovascular sequelae; rheumatoid arthritis; diabetic retinopathy; chronic inflammation; cyclic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Length 11;

to cyclisation are used to interfere with angiogenesis,
neovascularisation or lymphangiogenesis in a mammal with a condition
characterised by angiogenesis, neovascularisation or lymphangiogenesis.
The condition is diabetic retinopathy, psortasis, arthropathy,
hemangioma, vascularised malignant or benign tumour, post-recovery
cerebrovascular accident, post-angioplasty restenosis, head, head, or cold
trauma, substance-induced neovascularisation of the liver, excessive
hormone-related angiogenic dysfunction, diabetes induced neovascular
sequelae, hypertension induced neovascular sequelae, or chronic liver
infection. The peptides are also used to modulate vascular permeability
in a mammal (the mammal has a condition characterised by fluid
accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura,
or brain. The peptides are used to image blood vessels and lymphatic
vasculature. The monomeric and bicyclic peptides are used to interfere
with at least one biological activity induced by VEGF. Or -D and
are also used in combination with an anti-inflammatory agent, to treat a
chronic inflammation, especially rheumatoid arthritis, psoriasis and

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human SEGED (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabeta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            or cold

                                                                                                                                                                                                                                              셤
                                                                                                                                                                                                                                                                                                                                                                                                  The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by axidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with anglogenesis.

The condition is used to interfere with anglogenesis.

Characterised by anglogenesis, neovascularisation or lymphangiogenesis.

The condition is diabetic retinopathy, psoriasis, arthropathy, chemagioma, vascularised malignant or benign tumour, post-recovery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  or cold
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cerebrovascular accident, post-angioplasty restences, head, heat or coltrauma, substance-induced neovascularisation of the liver, excessive hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF, VEGF-C or -D and
                                                                                                                                                                                                                                                                                                                            Human, VEGF; vascular endothelial growth factor; angiogenesis; neovisacilarisation; lymphangiogenesis; psoriasis; tumour; diabetes induced neovascular sequelae; rheumatoid arthritis; diabetic retinopathy; chronic inflammation; cyclic.

Angiogenesis-associated polypeptides are: members of the vascular endothelial growth factor (WEGF) family, especially the 121, 165 or 189 isoforms of WEGF-A, the 167 isoform of WEGF-B, or VEGF-C or -D; a (CO-) receptor of WEGF, particularly WEGFR-1, 2 or -3; NRP-1 or -2 (members of the neuropilin family); or placental growth factor. (A) is used for treatment or prevention of tumors in mammals, particularly humans but also farm animals and pets, also many other conditions associated with excessive anglogenesis, specifically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Active immunization against angiogenic proteins, useful for treating e.g. tumors and inflammation, particularly contains vascular endothelial growth factor or its receptor.
are also used in combination with an anti-inflammatory agent, to treat chronic inflammation, especially rheumatoid arthritis, psoriasis and diabetic retinopathy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ophthalmological; gynecological; antiarteriosclerotic; virucide; hepatotropic; dermatological; anti-HIV; antidiabetic; antipsoriatic; antirheritic; antithyroid; immunization; angiogenesis; vascular endothelial growth factor; VEGF; neuropiln; placental growth factor; tumor; neoplasias; metastases; inflammation; autoimmunity; eye disease; arthritis; endometriosis; arteriosclerosis; edema; hepatitis; kaposi sarcoma; diabetic retinopath; treunatoid arthritis; thyroiditis; diabetic retinopath; transplant rejection; macular degeneration; neovascular glaucoma;

ö
malignant or benign neoplasias (and their metastases), acute or chronic inflammation, autoimmunity and eye diseases (claimed). Among the diseases that may be treated are arthritis, endometriosis, arteriosclerosis, edema, infectious diseases (hepatitis endometriosis arcoma), diabetes, psoriasis, rheumatoid arthritis, thyroiditis, diabetic retinopathy, transplant rejection, macular degeneration, neovascular glaucoma, hemangioma and angiofibroma. The method destroys cells that are the source of angiogenic proteins, rather than just neutralizing the activity of such proteins (as in passive immunization). This sequence represents an immunisation peptides of the invention derived from the VEGF proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an active immunization against angiogenic proteins comprising administration of a vaccination composition (A), optionally containing an adjuvant, that comprises polypeptides (I) directly associated with an increase in angiogenesis, their variants, or their encoding polynucleotides (II). Angiogenesis-associated polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Active immunization against angiogenic proteins, useful for treating e.g. tumors and inflammation, particularly contains vascular endothelial growth factor or its receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ophthalmological; gynecological; antiarteriosclerotic; virucide; hepatotropic; dermatological; antiarteriosclerotic; virucide; hepatotropic; dermatological; anti-HIV, antidiabetic; antipsoriatic; antiarchritic; antithyroid; immunization; angiogenesis; vascular endothelial growth factor; VEGF; neuropilin; placental growth factor; tumor; neoplasias; metastases; inflammation; autoimmunity; eye disease; arthritis; endometriosis; arteriosclerosis; edema; hepatitis; Kaposi sarcoma; diabetes; psoriasis; rheumatoid arthritis; thyroiditis; diabetes; psoriasis; transplant rejection; macular degeneration; neovascular glaucoma;
                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human VEGF-D-derived peptide #20 for anti-angiogenesis treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               antiangiogenic; cytostatic; antiinflammatory; immunosuppressive;
                                                                                                                                                                                                                                                                                                                        .;

cc are: members of the vascular endothelial growth factor (VEGF) family, especially the 121, 165 or 189 isoforms of VEGF-A, the 167 isoform of CC VEGF-B, or VEGF-C or -D; a (co-)receptor of VEGF, particularly VEGFR-1, -C 2 or -3; NRP-1 or -2 (members of the neuropilin family); or placental cc growth factor. (A) is used for treatment or prevention of tumors in mammals, particularly humans but also farm animals and pets, also many conforms associated with excessive anglogenesis, specifically conform or benign neoplasias (and their metastases), acute or chronic inflammation, autoimmunity and eye diseases (claimed). Among the diseases of that may be treated are arthritis, endometriosis, arteriosclerosis, cedema, infectious diseases (hepatitis and Kaposi sarcoma), diabetes, psoriasis, rheumatoid arthritis, thyvoiditis, diabetic retinopathy, transplant rejection, macular degeneration, neovascular glaucoma, common of aniocolistic macular degeneration, energial and the are the

WEGEP (Vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabeta carbon separation distances on opposite antiparallel strands of a petide loop fragment from an exposed loop of a growth factor protein and peptide loop fragment from an exposed loop of a growth factor protein and peptide loop fragment from an exposed loop of a growth factor protein and peptide by oxidising the cysteine residues. The monocyclic peptides id measured by monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with anglogenesis. The monography of the condition is diabetic retinopathy, psoriasis, arthropathy, corporately accularised by anglogenesis, neovascularisation or lymphangiogenesis. The condition is diabetic retinopathy, psoriasis, arthropathy, cerebrovascular accident, post-angloplasty restenosis, head, heat or clauma, substance-induced neovascularisation of the liver, excessive trauma, substance-induced neovascularisation of the liver, excessive corporated anglogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability corbrain. The peptides are used to image blood vessels and lymphatic or brain. The peptides are used to image blood vessels and lymphatic vibranture. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF, VEGF-C or D and are incorporation with an anti-inflammatory agent, to treat a chronic inflammation with an anti-inflammatory agent, to treat a chronic inflammation with an anti-inflammatory agent, to treat a chronic inflammation with an anti-inflammatory agent, to treat a chronic reference with the complete of the complet

Identifying proteins or peptide(s) which bind a ligand - by screening a

```
These bind (partially) a monoclonal antibody, ie. anti-CEA C46.9-2 (AARS8411).

These bind (partially) a monoclonal antibody, ie. anti-CEA C46 (anticates bind (partially) a monoclonal antibody, ie. anti-CEA C46 (anticates bind (partially) a monoclonal antibody, ie. anti-CEA C46 (anticates bind (partially) a monoclonal antibody, ie. anti-CEA C46 (anticated carcinoembryonic antigen). TSAR peptides are generated using generic coligonuclectides (see AAQ70470-73 for examples). TSARs are concatenated heterofunctional proteins or peptides. Comprising at least two functional regions - a binding domain with affinity for a ligand and a second refector peptide portion that is chemically or biologically active. They may further comprising a TSAR binding domain can be used in vivo to deliver comprising a TSAR binding domain can be used in vivo to deliver comprising a TSAR binding domain can be used in vivo to deliver comparted, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macronolecules eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process. (Updated on 25-MAR-2003 to correct PN

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequences given in AAW12551-70 represent core peptides of an src homology region 2 (SH2) binding peptide which correspond to the formula: 27-x-28-x X = any D- or L- amino acid; 27 = phosphotycosine or its isostere; 28 = asparagine or its isostere; the amino terminus is acylated, and the peptide is less than 14 residues in length, with the proviso that if Z7 is phosphotyrosine and Z8 is asparagine, then the peptides is not GRGZYZSMPLL. SH2 binding peptides containing these core peptides are used to treat of diagnose diseases associated with aberrant cell growth, differentiation or regulation which is associated with inhibiting a cellular signal transduction pathway. By partially blocking or inhibiting a cellular signal transduction disease or insulin-resistant (or non-insulin dependent) diabetes
in gene therapy and as vaccines. The present sequence is CA125/MUC16 O-
                                                                                                                                                                                                                                                                      Core peptide; src homology region 2 binding peptide; SH2; cell growth; differentiation; regulation; receptor tyrosine kinase pathway; cancer; signal transduction pathway; non-insulin dependent diabetes; insulin-resistant diabetes.
                                                                                                                                                                                                                                                                                                                                                                             /label= OTHER

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents a core peptide of an arc homology region 2 (SH2) binding peptide corresponding to the formula: Z7-X-Z8-X X = any D- or L-mainto acid; Z7 = phosphoryrosine or its isostere; Z8 = asparagine or its isostere; the amino terminus is acylated, and the peptide is less than 1 residues in length, with the proviso that if Z7 is phosphotyrosine and Z8 is asparagine, then the peptide is not GGCXXXXXXXLL. SH2 binding peptides containing this core peptide are used to treat of diagnose diseases associated with aberrant cell growth, differentiation or regulation which is associated with defects in receptor tyrosine kinase transduction pathway. The disease may be cancer, a developmental or differentiation disease or insulin-resistant (or non-insulin dependent)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Core peptide; src homology region 2 binding peptide; SH2; cell growth; differentiation; regulation; receptor tyrosine kinase pathway; cancer; signal transduction pathway; non-insulin dependent diabetes; insulin-resistant diabetes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to a novel polypeptide encoded by an alternative reading frame of a pathogenic virus, where the polypeptide starts with a methionine amino acid residue, which comprises an antigenic determinant and more than 7 amino acid residues. The invention may be useful for the production of compounds with a virucide activity or the development of a vaccine. The polypeptide or its fragments may be useful as a therapeutic agent. It is also useful for the manufacture of a medicament for treating or preventing an infection with the pathogenic virus. The present sequence is that of a hepatitis C virus CTL epitope peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New polypeptide encoded by an alternative reading frame of a pathogenic virus comprising an antigenic determinant, useful for treating or preventing an infection with the pathogenic virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

Patent No. US2002065218A1

GENERAL INFORMATION:

APPLICANT: ACHEN, Marc

APPLICANT: HUGHES, Richard

APPLICANT: CENDRON, Angela

TILLE OF INVENTION: VGEP-D/VEGF-C/VEGF PEPTIDOMIMETIC INHIBITOR

FILE REFERENCE: 1064/48505 Achen et al

CURRENT APPLICATION NUMBER: US/09/761,636A

CURRENT FILING DATE: 2001-01-18

PRIOR PILING DATE: 2000-01-18

Sequence 33, Application US/08331383

Sequence 33, Application US/08331383

Patent No. 5658809

APPLICANT: Komoriya, Akira

APPLICANT: Backard W. Beverly S.

TITLE OF INVENTION: Compositions for the Detection of

TITLE OF INVENTION: Thereof

TITLE OF INVENTION: Thereof

NUMBER OF SEQUENCES: 56

CORRESPONDENCE ADDRESS:

ADDRESSEE: Townsend and Townsend Khourie and Crew

STRET: One Market Plaza, Steuart Tower, Suite 2000

CITY: San Francisco

STATE: California

COUNTRY: USA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    42.6%; Score 26; DB 2; Length 8; 57.1%; Pred. Patent No. 5714342

GENERAL INFORMATION:

APPLICANT: Fackard, Beverly S.

TITLE OF INVENTION: Compositions for the Detection of

TITLE OF INVENTION: Protease in Biological Samples and Methods of Use Thereof

CORRESPONDENCES: 56

CORRESPONDENCES: Townsend and Townsend and Crew LLP

STREET: Two Embarcadero Center, Eighth Floor

CITY: San Francisco

STATE: California

COUNTRY: USA
                                                                                                                                                                                                       ;
                                                                                                                                                                                                       Gape
                                                                                                                                                                                                    ;;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

Sequence 26, Application US/08519109B

Patent No. 5865448

PAPELICANT: Arrhenius, Thomas S.
APPLICANT: Tempozyk, Anna
APPLICANT: Elices, Marian J.
APPLICANT: Cheng, Zhong-Li
TITLE OF INVENTION: Cyclic CS-1 Peptidomimetics,
TITLE OF INVENTION: Compositions and Methods of Using Same NUMBER OF SEQUENCES: 33
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match 41.0%; Score 25; DB 2; Length 10; Best Local Similarity 44.4%; Pred. No. 4.7e+02; Matches 4; Conservative 2; Mismatches 3; Indels

NAME/KEY: Phakellistatin 10
NAME/KEY: amino acid analysis, high resolution
NAME/KEY: nuclear magnetic resonance and mass
NAME/KEY: spectral MS/MS techniques
OTHER INFORMATION: Phakellistatin 10 is a
OTHER INFORMATION: cell growth inhibitory peptide with
OTHER INFORMATION: activity in mutine lymphocytic leukemia
OTHER INFORMATION: cell line of 2.1 mg/ml.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 26, Application US/08483077C

Patent No. 5811391

GENERAL INFORMATION:
APPLICANT: Arrhenius, Thomas S.
APPLICANT: Tempczyk, Anna
APPLICANT: Tempczyk, Anna
APPLICANT: Blices, Mariano J.
APPLICANT: Cyclic CS-1 Peptidomimetics,
TITLE OF INVENTION: Cyclic CS-1 Peptidomimetics,
TITLE OF INVENTION: Compositions and Methods of Using Same
NUMBER OF SEQUENCES: 33

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
